EPICRISIS

Mr. _____, born in 1936, case history № n/a, polyclinic № other, was present in the ward since October 14, 2002 until October 18, 2002 and passed 4 clinical days.

CLINICAL DIAGNOSIS: 4th degree cancer of sigmoid colon, metastases in peritoneum, diaphragm and in the big epiploon. The condition after operation is as described by Hartmann on September 19, 2002. Chemotherapy. Ischemic heart disease. Tension stenocardia, functional class: postinfarction atherosclerotic cardiosclerosis.

The patient was hospitalized in the planned order for passing the 1st chemotherapy course. He was operated regarding the cancer of sigmoid colon on September 19, 2002. During the operation the metastases in peritoneum, diaphragm and big epiploon were discovered. The obstructive resection of the sigmoid colon was performed. The condition of the patient at entry was satisfactory. The patient complains of moderate pain in the abdomen without precise localization, periodic belting pains complicating respiration. No particularities found in the heart and in the lungs. The abdomen is not swollen and is soft, but slightly painful in all the sections at palpation. The ostomy is functioning.

Oncologist: holding of polychemotherapy with eloxatine 150 mg intravenously, 5-fluorouracil 500 mg and leukovorin 25 mg intravenously during 5 days.

The patient passed chemotherapy satisfactorily. After treatment the abdomen and belting pains have ceased. The inconsiderable hiccup attacks started to appear periodically, which were eliminated by administration of torekan.

Clinical blood test: haemoglobin — 11.6 gr, erythrocytes — 4.05 million, leukocytes — 5000, erythrocyte sedimentation rate — 50 mm/h.

Biochemical blood test: doesn't contain any deviations from standard.

The patient was discharged under medical observation of the polyclinic specialists. The repeated hospitalization on October 11, 2002 is recommended for passing the 2nd chemotherapy course.
